

Scarecrow

In 1939's classic film *The Wizard of Oz*, Scarecrow has an interesting part to play in the story. He tells Dorothy that he "can't think" because he doesn't have a brain. Then for the rest of the story he shows himself to be probably its most resourceful character.

The one time he shows academic knowledge is after he receives his diploma from Professor Marvel.

In reciting the Pythagorean Theorem, he gets it wrong.

What can Scarecrow teach us about intelligence?
